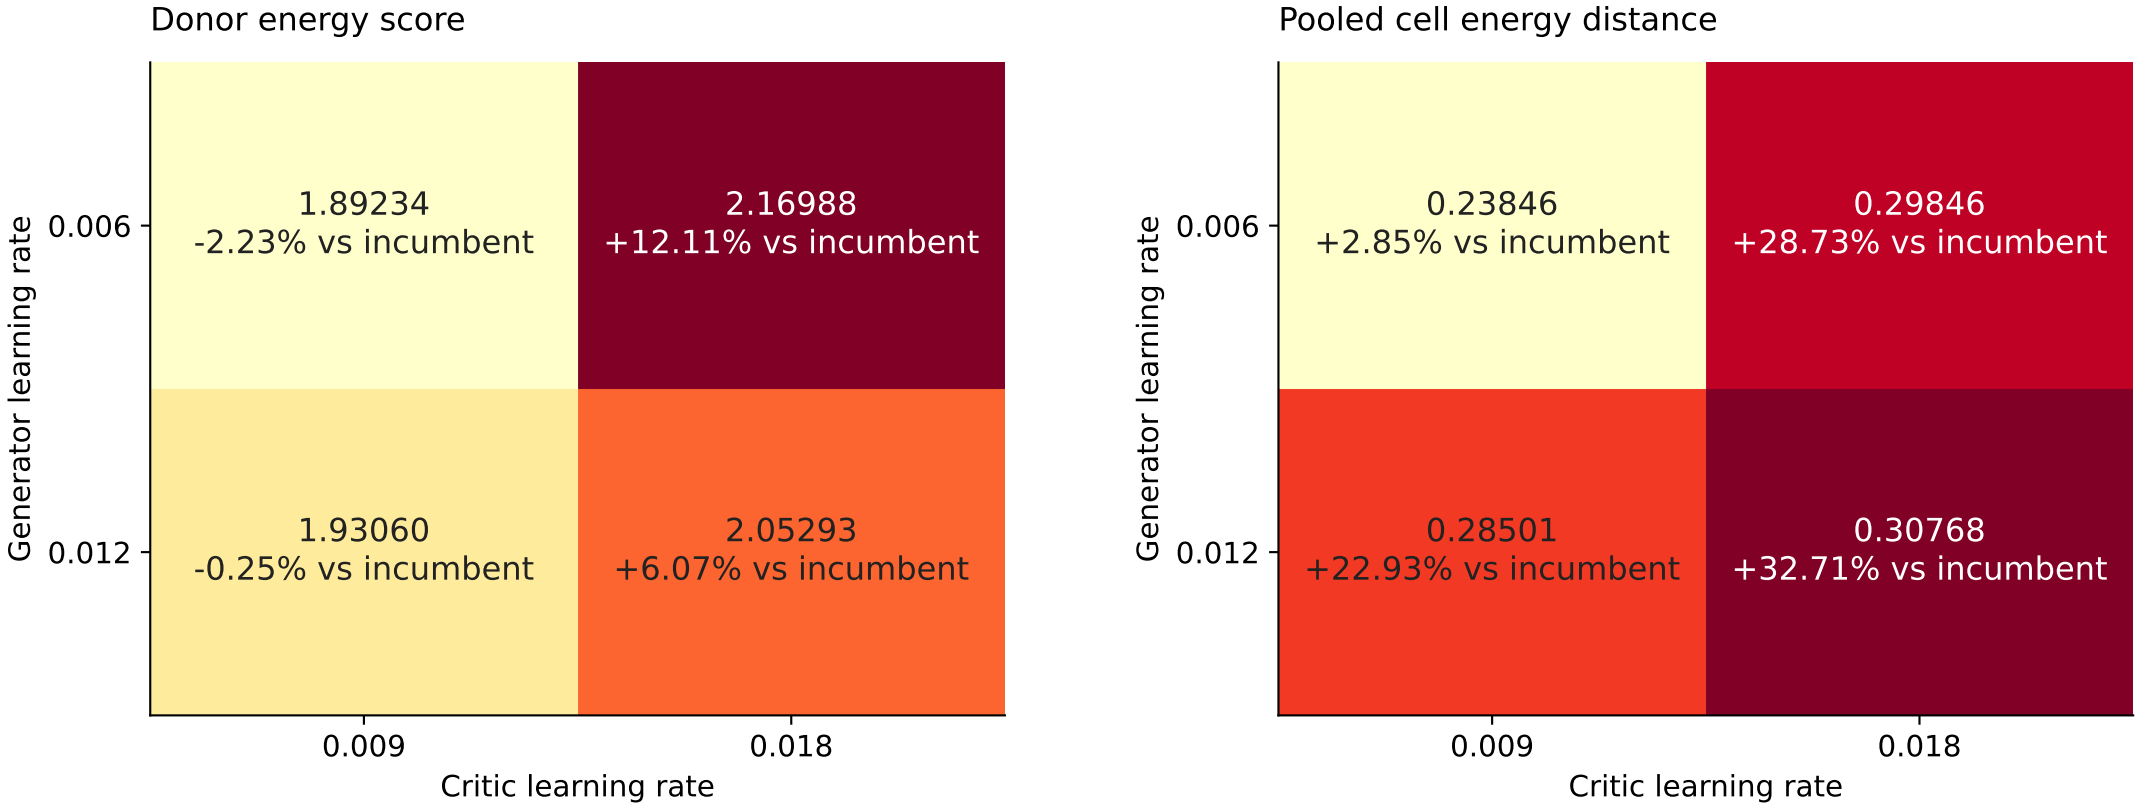
Generator and critic rates: observed interaction

Released BISPF | particles 0.015 | fixed 20,000 updates | fold 0, seed 0

All four completed endpoints independently audited. Lower is better for both metrics.



Each cell is a final endpoint; a promising energy value alone cannot select a model.

Four adaptive calibration donors; two generation replicas per model. These are descriptive fixed-seed contrasts.

Parameter-dependent random draws can diverge. Evaluation donors remain excluded; no stable joint ATH is claimed.
