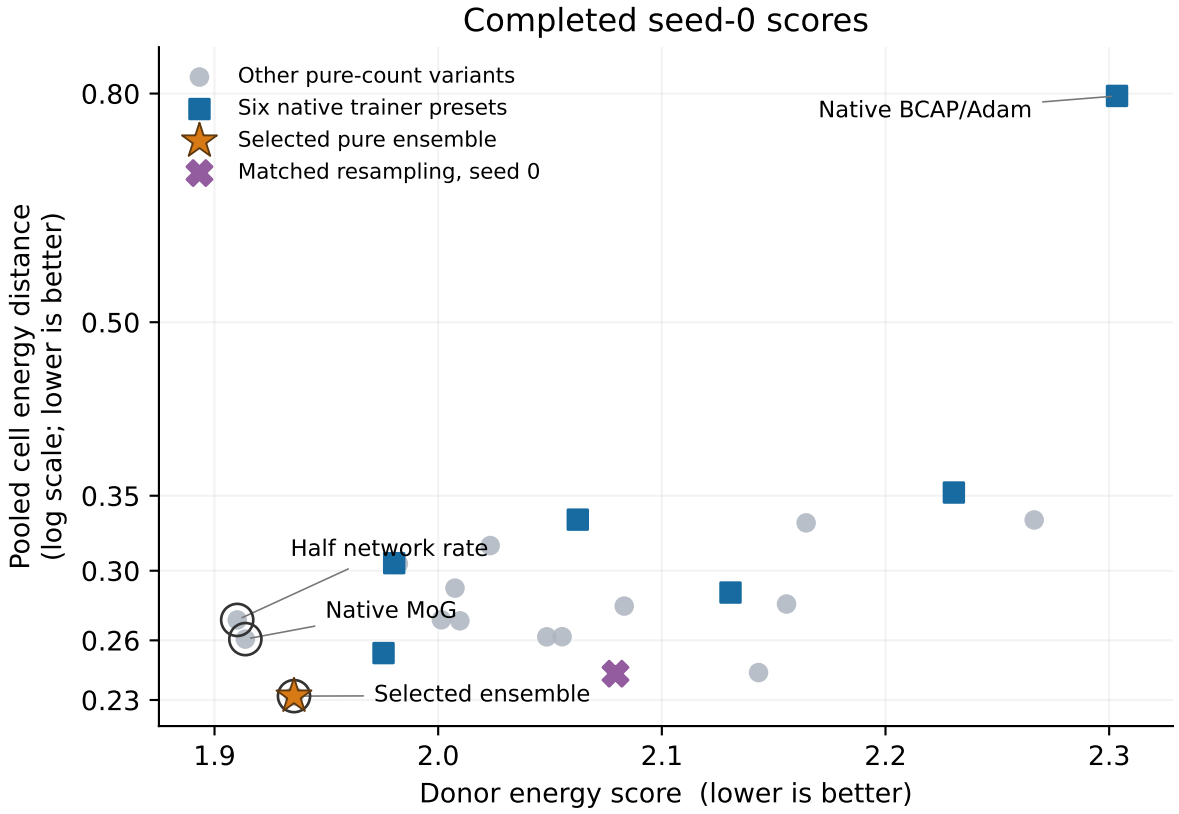
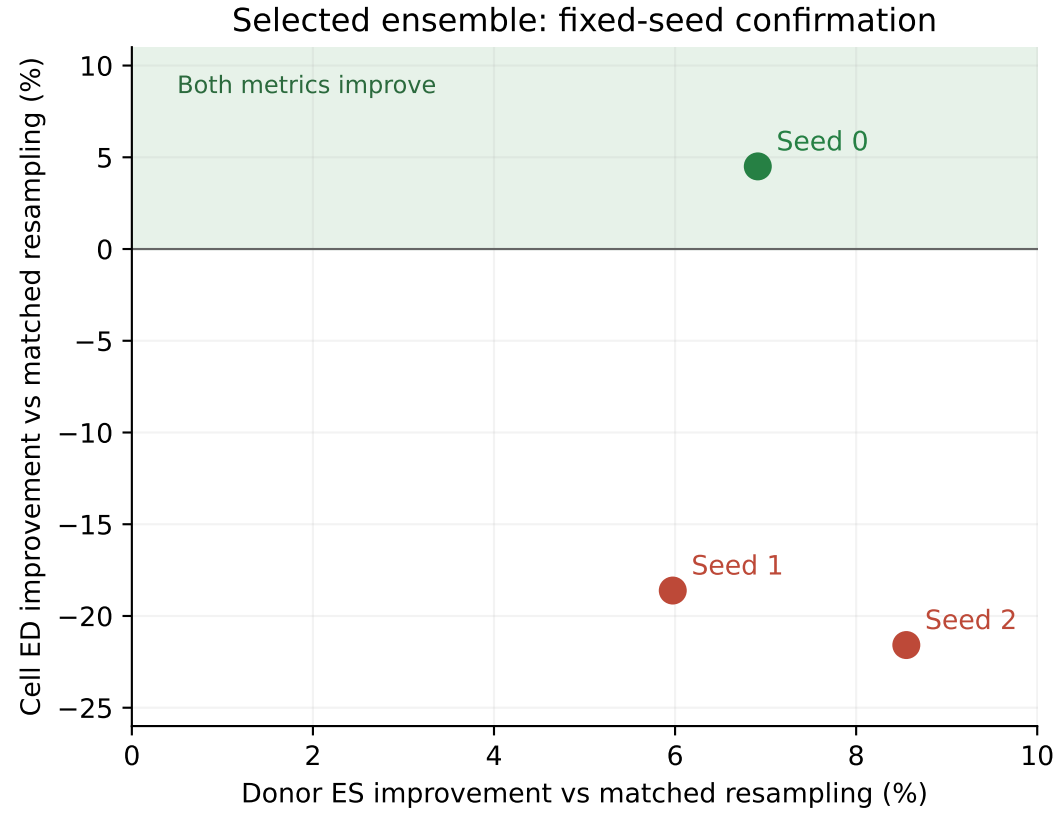
Donor energy gains often come with worse cell distribution match

21 completed seed-0 pure-count comparisons; fixed confirmation uses the original three seeds.





Confirmation mean ES improves 7.16%, but seeds 1 and 2 worsen cell match. Stable joint test: FAILED.

Same four adaptive calibration donors throughout; seeds are training repeats, not independent biological donors.

20 evaluation donors remain excluded. Pending stage-prior/Halloween work has no point on this figure. No SOTA or generalization claim.
